Outcomes of myelodysplastic syndromes (MDS) reported in Western countries are relatively poor. We evaluated the outcomes of MDS in Japan with strict criteria and long-term follow-up. We evaluated the outcomes of 213 consecutive Japanese patients with MDS (median follow-up, 7.5 years; median survival, 7.4 years). Clinical risk categories of patients included five intermediate-1 (NCCN criteria) and two intermediate-2 (French-American-British [FAB] classification). A poor prognostic score was defined as > or =3 for any three of the following factors: age > or =70 years, hemoglobin or =2 as negative prognostic factors for both OS and FFS. We conclude that even "mature" MDS patients in Japan have considerable survival and a low rate of RDP. Additionally, there was no evidence of poor performance status. by Jared Sparks | Aug 23, 2014 | Collections | 0 The insect-like robot built by Max Planck Institute for Intelligent Systems (MPI-IS) researcher

Early last year, the Americans and their allies hammered the Taliban with intense bombing raids at the height of a surge in violence. By June, the Taliban was in retreat and the US pulled back American soldiers. A second surge to dislodge the Taliban from strongholds was instigated late last year, but it has also ended in failure. Now it is the Taliban who are calling the shots in Afghanistan, and they are using the same tried-and-tested tactics that have defeated the northern alliance of guerrillas and the US in the past.
