We have movies where the villain is a brilliant financial genius, like Gordon Gekko from Wall Street.

When someone buys all the virus needed to get out, would a virus care about the price of the malware, or how much a payment would be? Should we be worried that once we buy virus X, it might spread itself to other computers via a victim's bank account? A: In an answer to the question of how viruses spread, I would answer that virus X can spread by itself when it is given money. But it

is also true that virus X can also spread by itself when a victim shares files with others. In both cases, the source of the information is not limited to a single computer. A person can give or share without necessarily using a specific piece of software. So, the virus does not really care how much the person pays for it, nor even whether that person knows the virus is there. The virus

can spread as long

way we process personal data. AVI is a digital video file format first created by Microsoft, first released as part of Windows Media Video (WMV) on October 3, 2001. It is compatible with and can be played in the same programs as the widely used MP4 container format. AVI files can contain video information (the AVI file type), as well as audio information (the AVI file type), or a combination of

these. Unlike other container formats (such as MP3, Ogg Vorbis, etc.), AVI is a proprietary format that has also been embraced by Apple as a part of its QuickTime Player, allowing AVI files to be used in Mac OS. Digital Video (DV) has been the most common video encoding scheme used in film and video production since the early 1990s. Today the most common formats include M-

JPEG, H.264/MPEG-4 AVC, Motion JPEG, and QuickTime MOV. As digital signals became cheaper, the need for compression increased. This process is referred to as interleaving. This two-frame process works well for normal video. However, for things like fast motion, the result is the frames are out of sync and will cause a fl
